

Simulation and Modeling Assignment

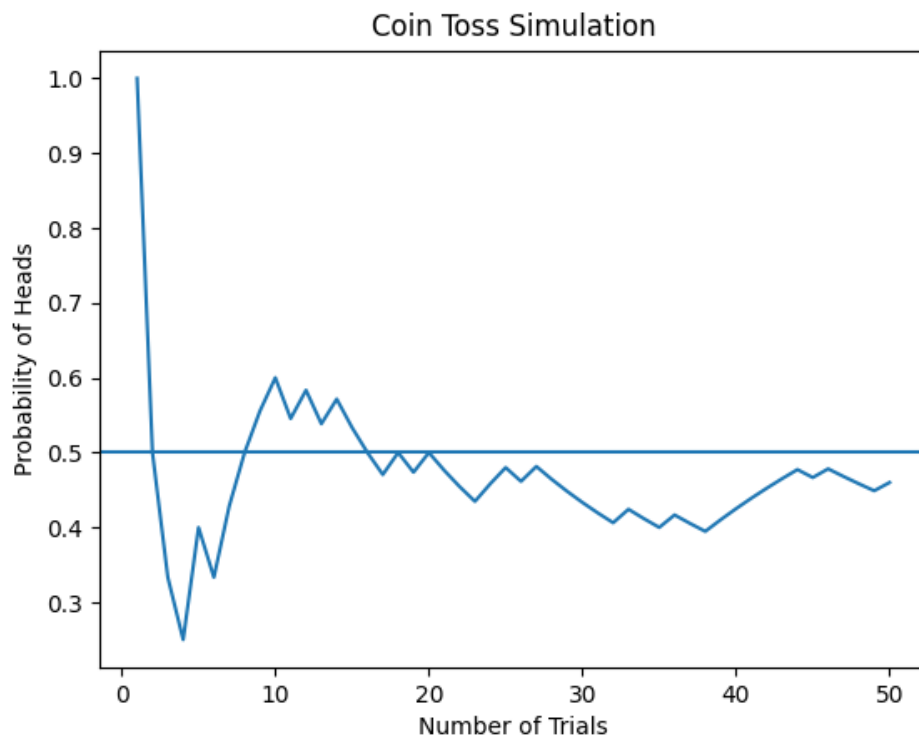

Introduction

A fair coin has two possible outcomes: Heads (H) and Tails (T). The theoretical probability of each outcome is 0.5. In real experiments, results may vary due to randomness.

Task 1 Results

Heads = 28, Tails = 22
 $P(H) = 0.56$, $P(T) = 0.44$

Task 2: Simulation Graph

Conclusion

As the number of trials increases, the experimental probability approaches the theoretical probability.
